BMW Transfer Case Motor 27607643762

CAD \$1,023.24

This is a new replacement BMW transfer case motor or the longitudinal torque module. The BMW transfer case motors are engineered to factory specifications, guaranteeing proper fit, form, and function.

In today's sophisticated AWD drivetrains, the transfer case is crucial for continuously synchronizing the rotational speed difference between the front and rear axles. Component failures, such as in the transfer case motor, clutches, and bearings, are common. Issues like uneven tire wear can cause excessive front-to-rear rotation differences, forcing the motor and clutches to engage more frequently, leading to accelerated wear and increased heat that degrades the transfer case fluid.

BMW Transfer Case Motor Failure Symptoms:

- Shifting problems: Difficulty shifting gears, getting stuck in a gear, or delayed engagement when shifting between two-wheel drive and four-wheel drive
- Noises: Strange grinding, growling, or humming noises
- Fluid puddle: A puddle of fluid under the transfer case
- Handling challenges: A damaged transfer case can make a vehicle unsafe to drive
