Solenoid Testing and Diagnostic Services For E6x SMG III

USD \$81.94

We are now offering solenoid testing and diagnostic services for your BMW E6x M5/M6 SMG III hydraulic system. We have the ability to test both the proportional pressure control valves and directional control valves. Our solenoid testing and diagnostic services will be carried out by trained technicians who have worked on these systems before. Typically a solenoid valve in the SMG III hydraulic system operating outside of it's design specifications will result in:

- The vehicle not being able to shift into or out of gear.
- The shift adaptation sequence failing.
- The clutch adaptation sequence failing.

During our testing and diagnostic procedure we will test for:

1. Leaks across the solenoid and o-rings
2. A functional test

If a solenoid passes all of the above tests we will replace all o-rings with our own viton grade seals. If a solenoid fails the leak test or functional test we will point you in the right direction. We decided to offer this service to customers who were unsure of which parts to change as the entire system is very intricate. We believe this is a cost effective solution and will help you in understanding what could be going wrong with the reliability of your hydraulic system.
